

A next-generation CAD platform

Built in India. Licensed to the world.

Directors' briefing

ITC figures are actual. Our projections are illustrative.

What we are proposing

- We are building **an engine we own** — and it is already running
- The same engine can carry **many brands, not just ours**
- That makes us **a platform business alongside a product business**

The proposal: build it platform-first from the outset.

Three things to work through together

- Corporate structure · Capital requirement · The team we build

Where the engineering stands

Phase 0 — six weeks, ~207 commits, 13+ releases to the ActCAD team

- **Customer DWG files open in the browser** — both WASM and ODA inWEB backends live
- **Full 14-mode osnap suite**, measurement, count, CSV and Excel export
- **250,000 entities at 61 fps** · regeneration 17× faster · instant zoom-extents
- **3D orbit, ViewCube, layouts and paper-space viewports**
- **DWG and PDF comparison**, colour plotting, batch print, markups
- **Windows MSI shipping** · macOS CI green · Android prototype
- **594 of 594 tests passing**

Benchmarking already puts it ahead of ActCAD on many customer files — and ahead of both IntelliCAD's viewer and ODA's own.

Architecture for the editor

Certain ODA capabilities are not exposed through the web stack.

- **To viewer launch** — continue on the current Rust/Tauri and WASM stack
- **After launch** — **migrate the full editor to Qt and C++ native**
- opens the ODA surface unavailable on web
- aligns with where the ActCAD team intends to work long term
- **The web viewer** — folds into the Qt stack, or remains separate
- decided with data during migration

The platform capabilities — tenant configuration, licensing, marketplace, AI — live in the C++ core either way.

The opportunity

- **~40 IntelliCAD Consortium members** — regional CAD vendors on the foundation we are leaving
- **~200 vertical ISVs** — MEP, structural, electrical, survey, solar
- **BIM-lite startups** — needing a CAD foundation they cannot afford to build

What they share

- A foundation that **cannot deliver AI, cloud, web or mobile**
- **A million lines of source they must maintain themselves**
- **No practical alternative** short of a multi-year rebuild

Nobody is currently offering them a modern engine as a product. That is the opening.

What we pay IntelliCAD today

Membership and extras	~\$100,000 per year
Per-seat royalty to ITC	None
Component royalties (ACIS and others)	\$15–20 per sale
AI module	~\$7–8,000 per year — experimental
Android viewer	~\$8,000 per year
macOS	Not available at any price
Web application and web editor	Not available at any price
Linux	Not available at any price

The fee buys source code, not a product — a codebase to staff, modify and re-merge at every version uptake.

IntelliCAD is Windows-bound. macOS, Linux and the browser are not options a member can buy — **they are doors that stay shut.**

What we would offer instead

Deliverable	~1M lines of source	A product they configure
Engine maintenance	The member's problem	Ours
Engine defects	Member fixes; work reaches rivals	We fix; member receives
Member's own plugins	Entangled with engine changes	Remain theirs
Release cadence	Annual, coordinated	Rolling
Platform reach	Windows only	Windows, macOS, Linux, web, Android
AI	Paid add-on	Included
Licensing infrastructure	Member sources their own	Included, and platform-blind

Commercial model

Three tiers

- **Core** — engine, DWG fidelity, white-label shell, licensing, AI
- **Plus** — adds web application, Mac, Android, marketplace
- **Complete** — adds our vertical modules (Arch, Mech, Elec, BIM, GIS)

MEMBER'S INSTALLED BASE	CORE	PLUS	COMPLETE
Under 5,000 seats	\$45K	\$65K	\$90K
5,000–20,000	\$80K	\$110K	\$150K
20,000–50,000	\$130K	\$170K	\$220K
50,000+	\$190K	\$240K	\$300K

- **Phased 50 / 75 / 100%** across each member's migration
- **Component royalties at cost · AI metered above an allowance**

Financial outlook

	CONSERVATIVE	BASE	AGGRESSIVE
Members by year 7	5	12	20
Average fee	~\$70K	~\$110K	~\$170K
Recurring revenue	~\$425K	~\$1.7M	~\$4.3M
Contribution	~\$290K	~\$1.2M	~\$3.1M
Indicative value at 6–8×	—	~\$10–13M	~\$26–34M

High-margin recurring revenue, earned on engineering we are funding anyway — and a second asset on the balance sheet.

- Beyond this: **60–100 members**, direct distribution, or the **3D product on C3D** each open a materially larger business

Investment required

STAGE	TIMING	AMOUNT
Promoter seed	Now to year 2	₹2 crore
Strategic round <i>(optional)</i>	Years 4–5	\$5–10M
Exit	Years 6–7	\$30–50M target

- The seed **funds the two-year build team** — next slide
- A strategic investor at years 4–5 **sets a valuation floor** ahead of any sale
- At ~70% margins the business **self-funds from year 3**

Team required — the two-year build

ROLE	HEADCOUNT	COST
CAD engine developers	2–4	₹100 lakh
Commands and UI developers	3–5	₹50 lakh
Marketing	1	₹25 lakh
Total	6–10 people	₹1.75 crore

₹2 crore seed against a ₹1.75 crore build — funded, with headroom.

A team this size is viable because of how we are building. Phase 0 delivered ~207 commits and a shipping viewer in six weeks with AI-assisted development — the UI, commands, tests and tooling layers move several times faster than they used to.

- **AI carries the commands and UI layer** — that is where the leverage is real
- **Engine work still needs people** — ODA and ACIS integration, performance, vendor defects. Hire these deliberately.
- This is **the team the next ActCAD engine needs regardless** — the platform shares it, it does not create it

Our approach

Build the platform capability now. Decide on commercialisation at month 24, with real data.

- The multi-tenant architecture **makes ActCAD better in its own right** — clean core, real plugin API, configuration over hard-coding
- Building it now costs **3–6 engineer-months**. Retrofitting later means **reworking six of ten modules**
- We reach the month-24 decision **having lost nothing if we decline it**

Engineering	Same	Same
Timeline to GA	~24 months	Unchanged
Revenue	ActCAD alone	Plus member fees and royalties
Assets	One product	Two separable assets

What we need to get right

PRIORITY	HOW WE ADDRESS IT
ActCAD GA comes first	Platform work is scoped and time-boxed around it
Build the team well	Needed for ActCAD regardless — the platform shares the cost
Prove demand before committing	Month-24 gate on two signed LOIs
Keep control of the roadmap	Members advise; we decide
Protect our verticals	Named-competitor exclusion; the tier stays optional
Set a realistic pace	Base case assumes 12 members over seven years

Each of these is a decision we hold, not a dependency we carry.

Governance and review gates

POINT	TEST	IF NOT MET
Month 12	8–10 qualified member conversations held	Outbound pauses; engineering continues
Month 24, at ActCAD GA	Two members at signed LOI	Commercialisation does not proceed
Before any vertical-tier sale	No conflict with ActCAD’s markets	Tier withheld from that member

Every gate is a decision this board takes, on evidence, at the time.

The name

From Sanskrit **takṣ** — *to shape, to carve, to fashion*. The root of **Takshashila**.

	LINE	WHAT A SEARCH TURNS UP
TAKSHON	<i>Design Beyond Boundaries</i>	Clear — no Indian technology company trading on the name
TAKSH	<i>Precision in Every Dimension</i>	Crowded — four Indian software firms already use it
TAKSHA	<i>Design. Simulate. Build.</i>	Conflict — Taksha AI & Robotics Pvt Ltd, plus robotics and engineering firms
VISTAAR	<i>From Structures to Skylines</i>	Strong BIM story, but a common word in wide commercial use

TAKSHON is the recommendation — the only one of the four with room to own the category.

- Sub-brands follow naturally — **Engine · Cloud · Forge · SDK**
- These are web searches, **not register searches** — IP India Classes 9 and 42, plus USPTO and EUIPO, **before anything external**

Let's build it

A next-generation CAD platform, engineered in India, licensed to the world.

Where we'd like to go from here

- Build platform-first from the outset
- Work through structure, capital and team together

The engine is already running. The question is how far we take it.
